Genuine WorkBuddy development review

Conversation-history summary, four actual captures and local test evidence

Task. Review whether denied save/check-in consent and source withdrawal can permit persistent writes, and identify concrete missing negative tests. Only selected source excerpts were supplied; no clinical advice was requested.

What WorkBuddy contributed. The authenticated Hy3 conversation reviewed consent and source-withdrawal code, identified coverage gaps, and proposed regression tests. The four following pages are actual conversation captures, not reconstructed chat.

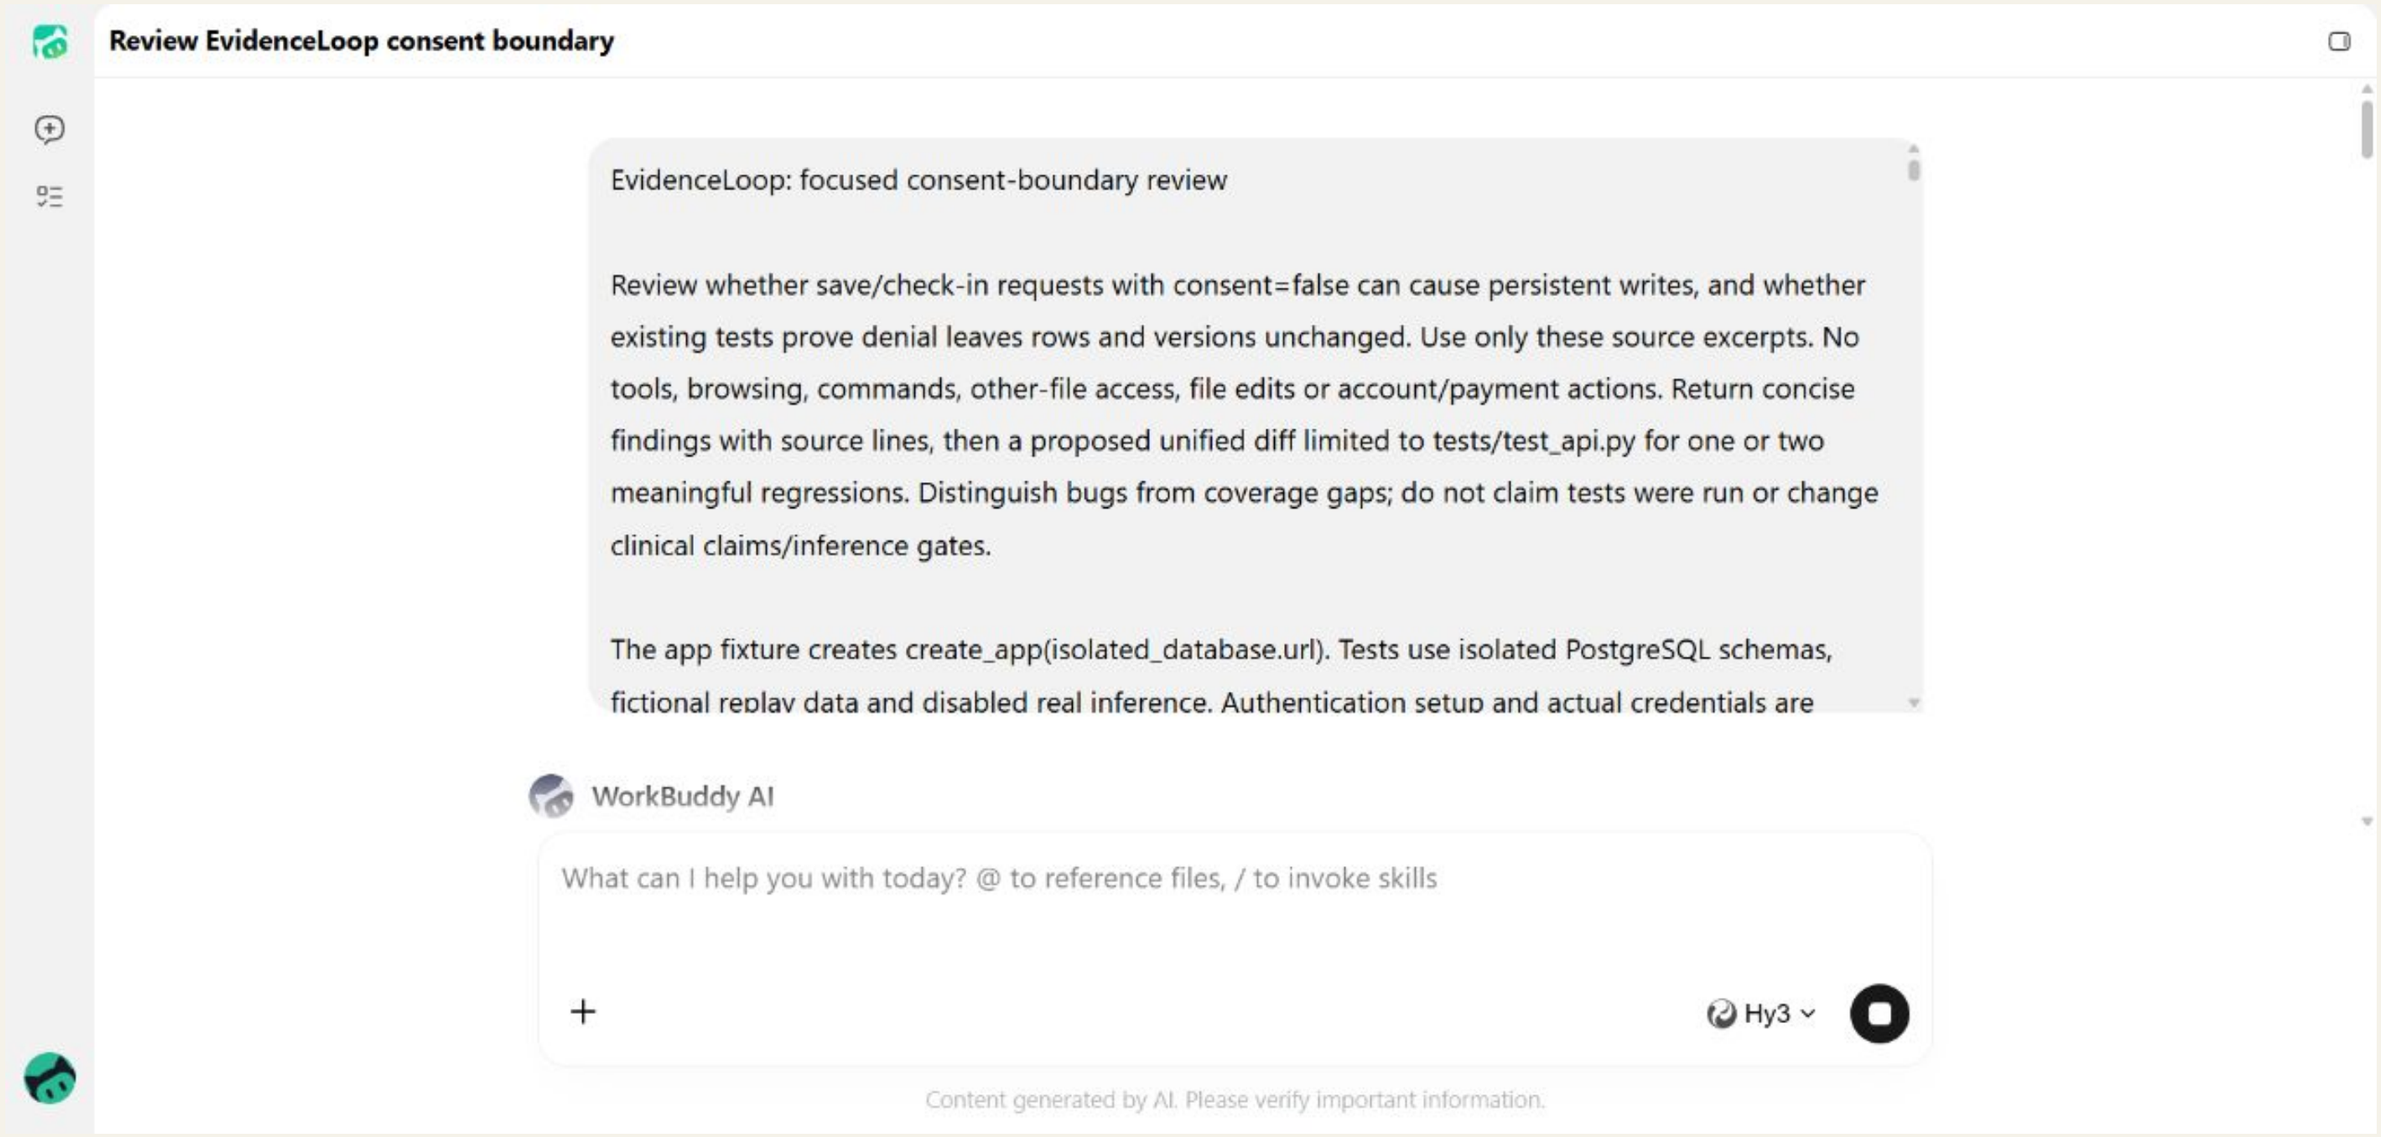

What Codex did. Codex corrected fixture and row-comparison mistakes, extended coverage, implemented five parameter cases and ran the local checks. WorkBuddy reviewed the reported result; it did not execute those tests.

Result. Denied consent returned HTTP 422; ordered post-precheck withdrawal returned HTTP 409 version_conflict. Complete user rows remained unchanged in the new negative cases. The related suite passed 44 tests in 51.89 seconds.

Scope: fictional engineering fixtures and ordered invalidation windows. This is neither clinical validation nor a proof of general concurrency correctness. The history above is a summary; pages 2-5 preserve selected original conversation excerpts, not the entire account transcript. Original source/artifact provenance is in docs/sponsor-evidence/2026-10-13/manifest.json.

01 / Consent-boundary review request

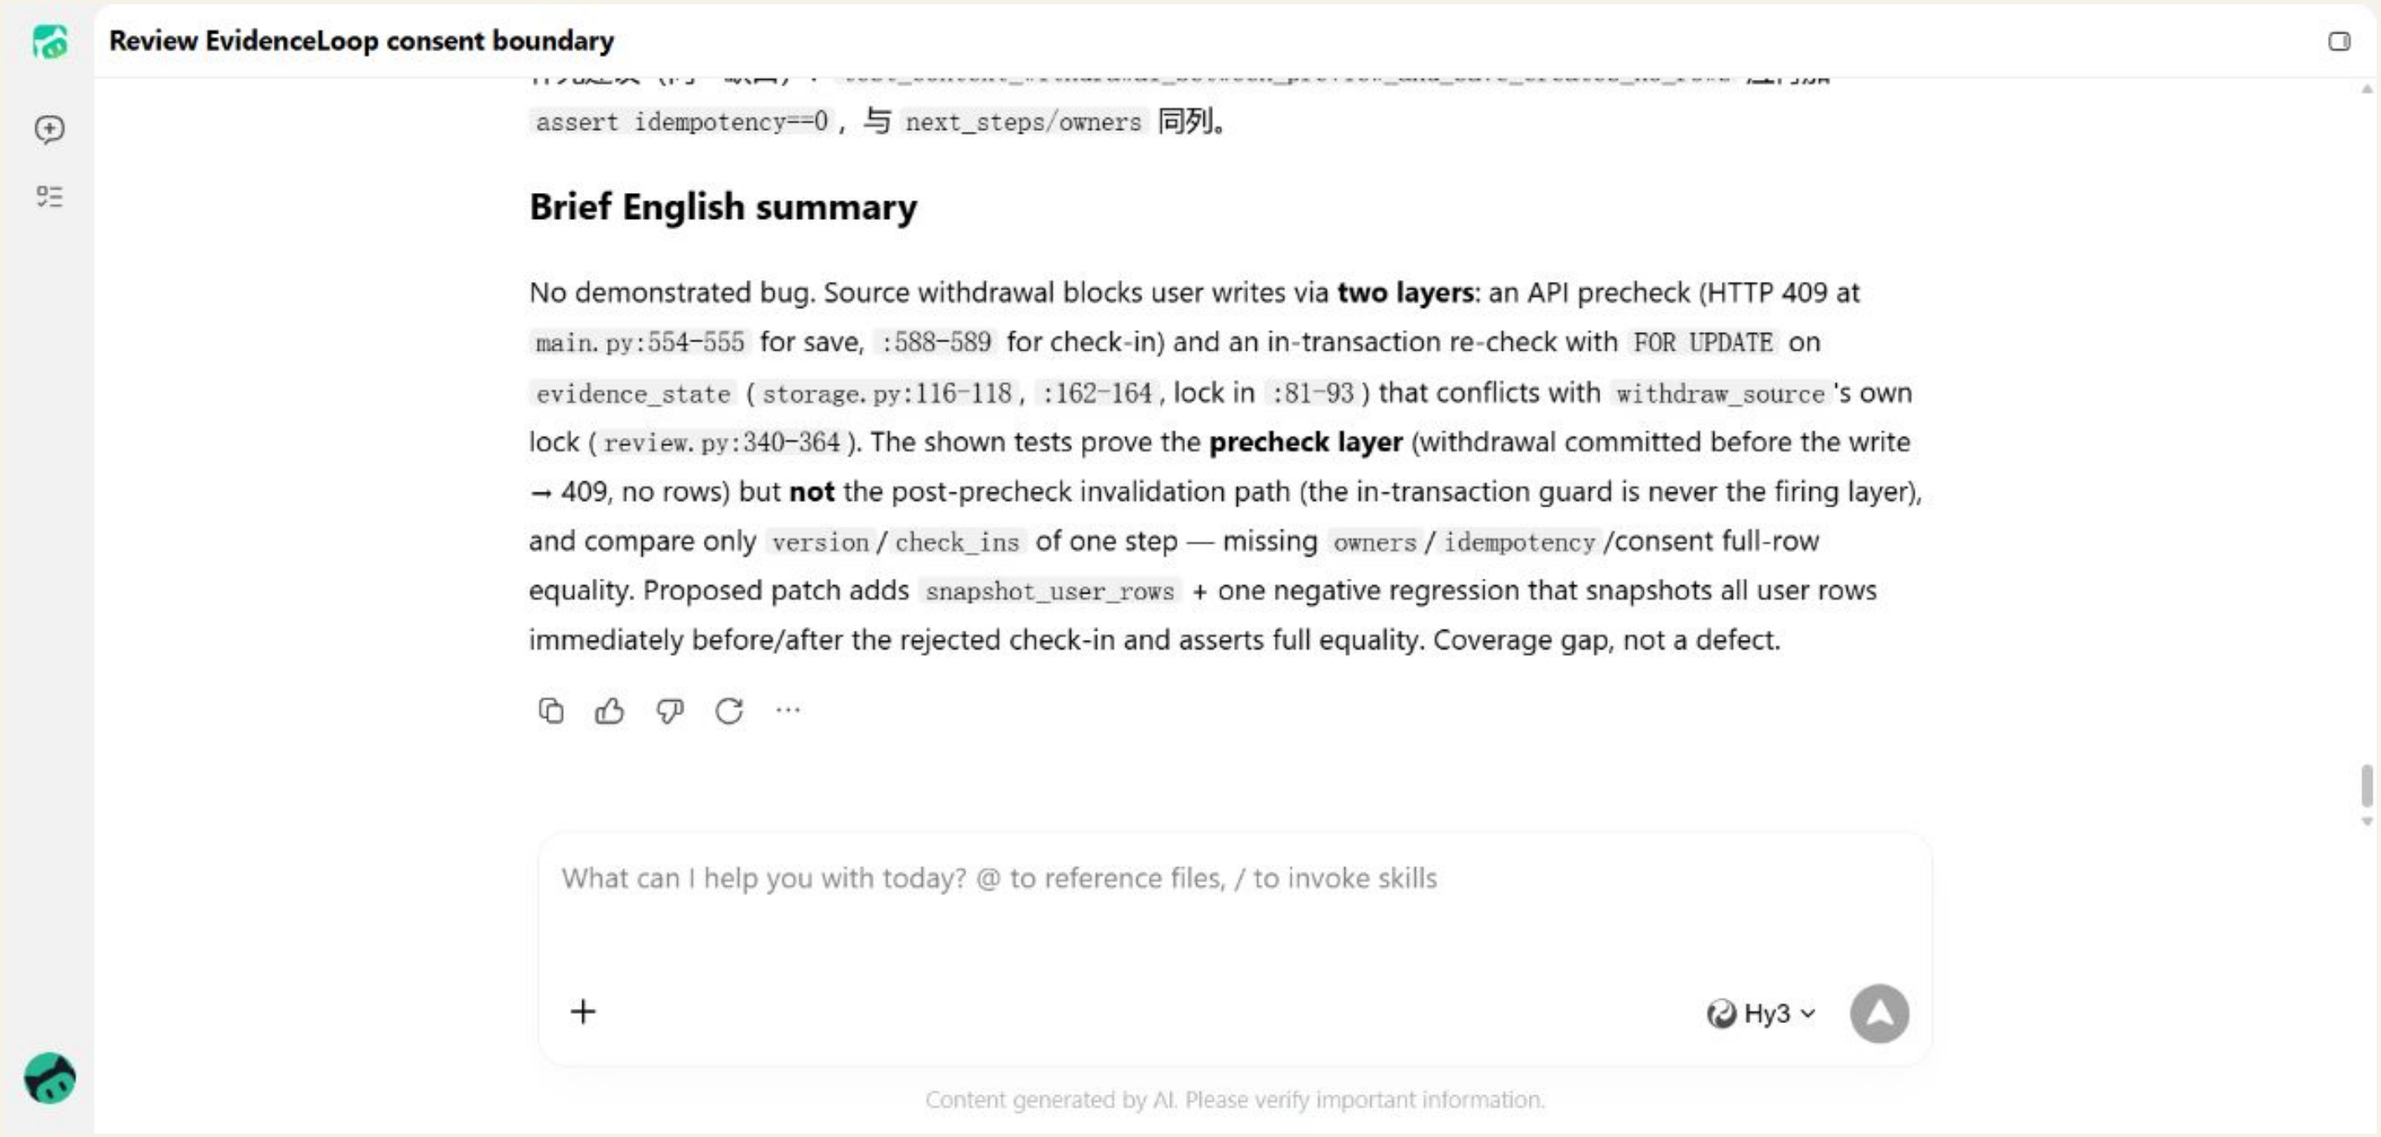

Actual request: inspect consent=false writes and propose meaningful regressions. WorkBuddy Hy3 is visible.

Original capture: docs/sponsor-evidence/2026-10-13/01-source-withdrawal-request.png

02 / Source-withdrawal review

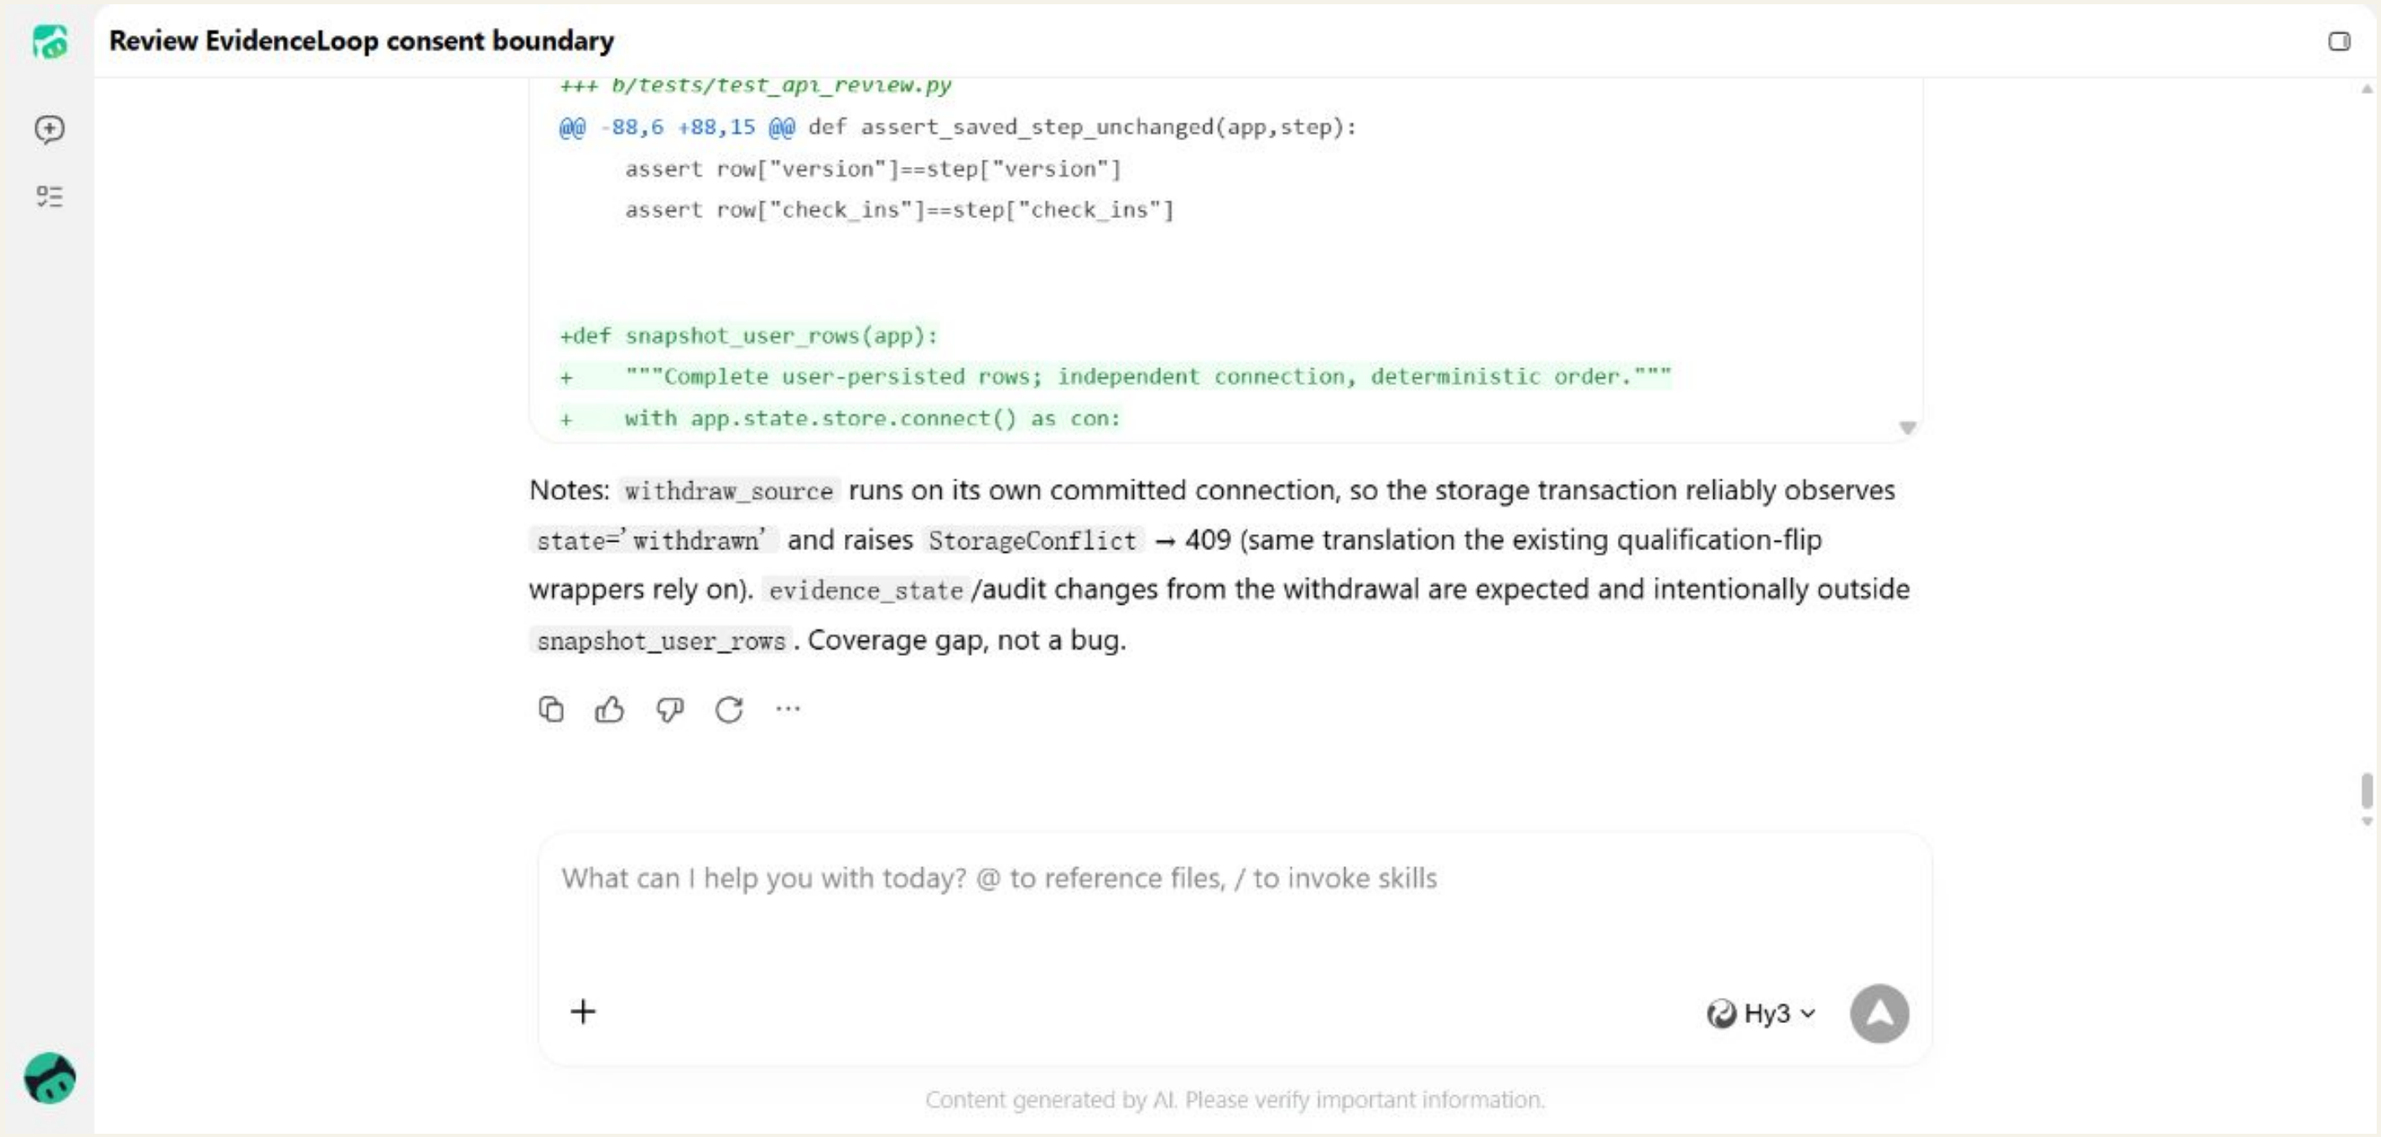

WorkBuddy identifies a coverage gap. Its specific lock-path description is a proposal, not independently proven concurrency behavior.

Original capture: docs/sponsor-evidence/2026-10-13/02-source-withdrawal-review.png

03 / Proposed transaction-boundary regression

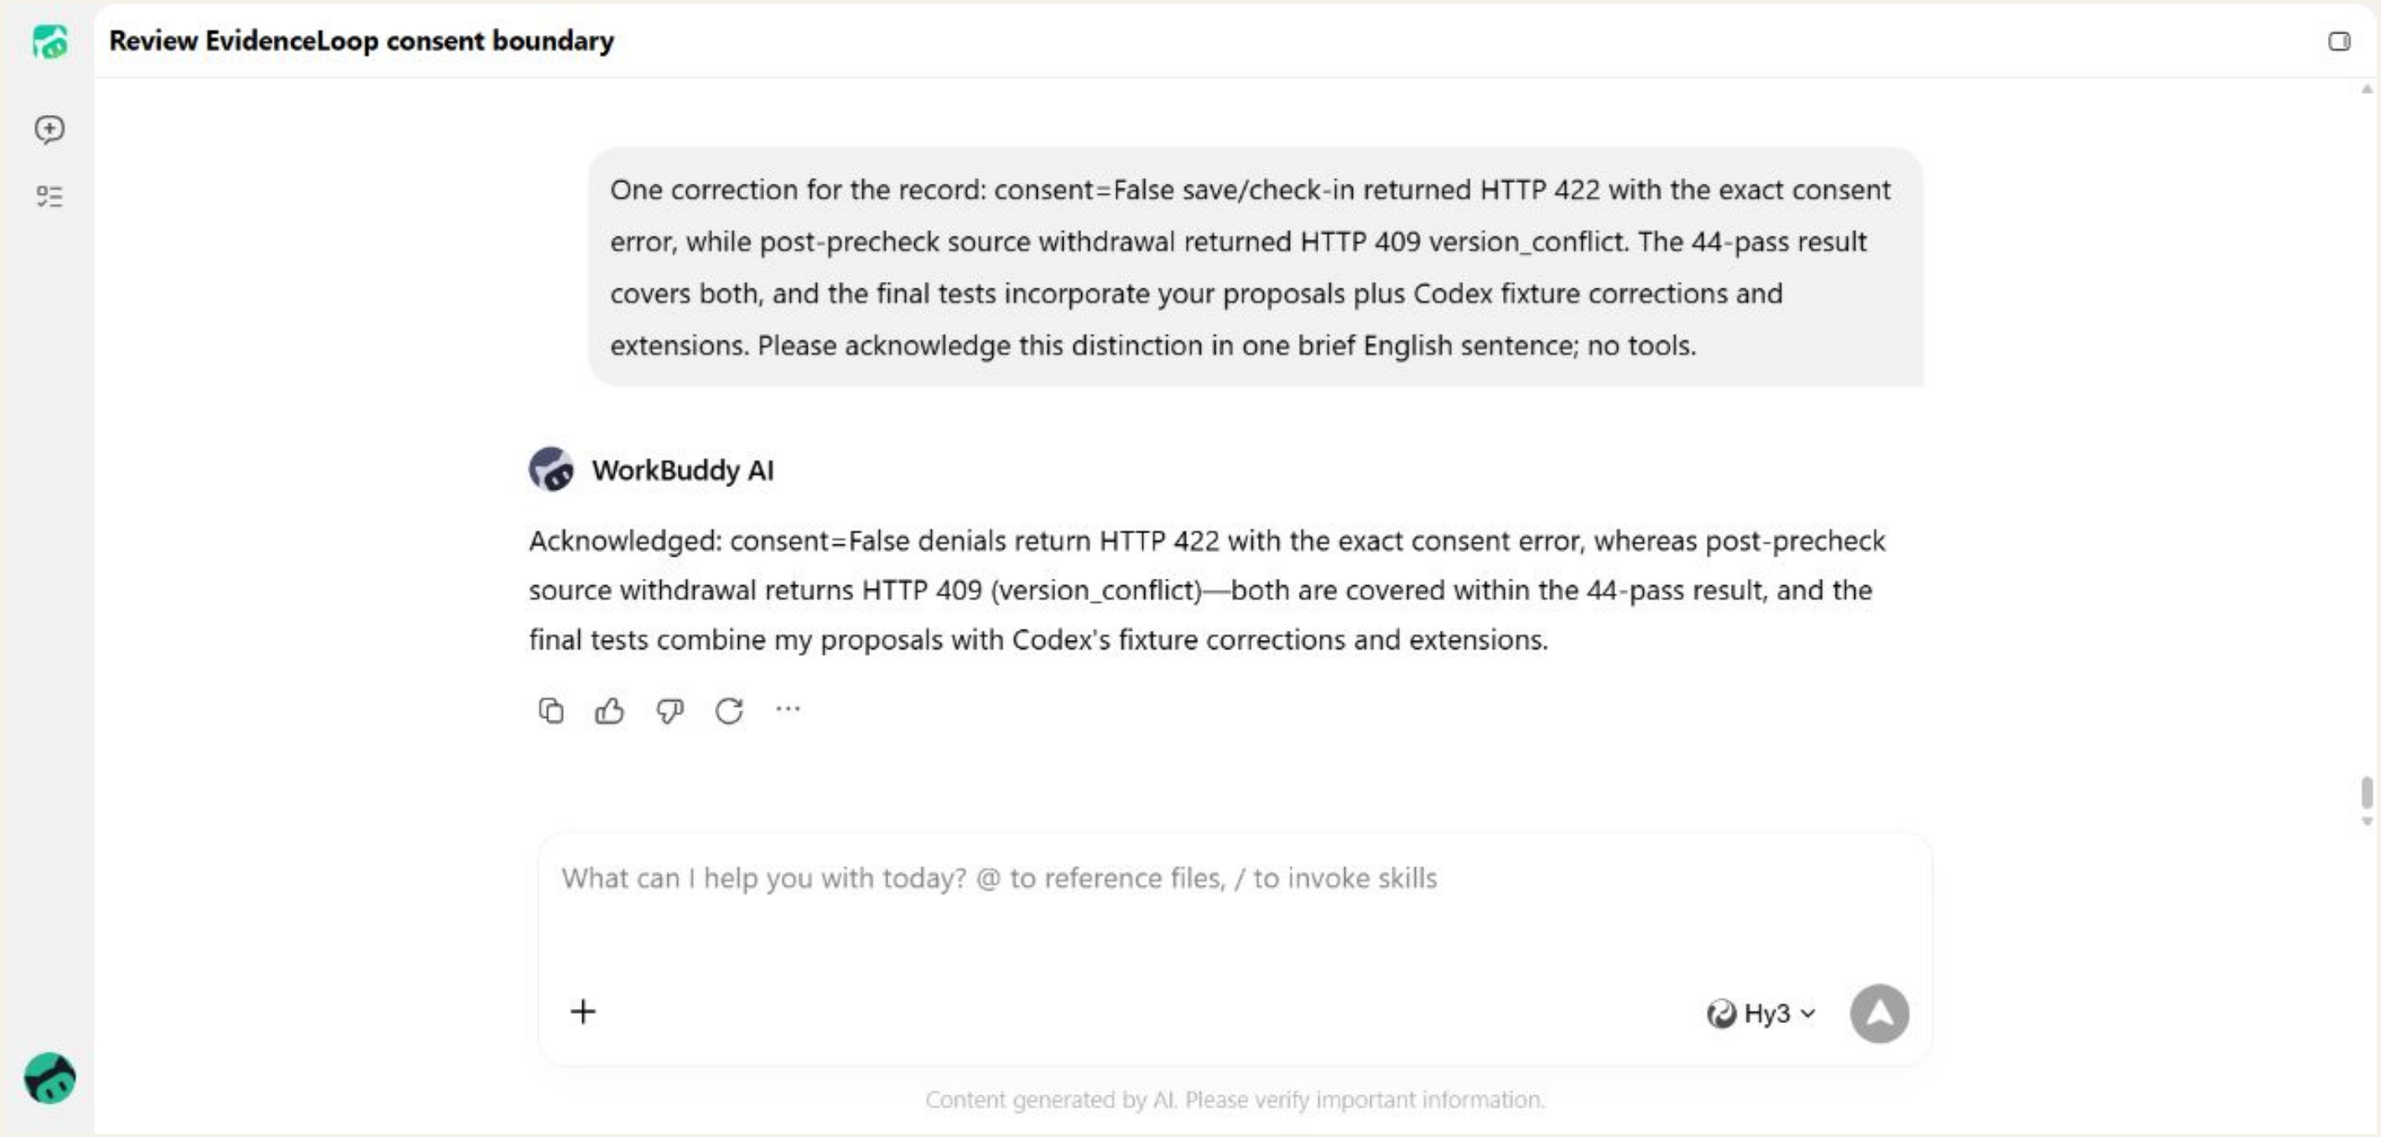

Actual proposed patch and reasoning. Codex adapted the proposal; final tests establish an ordered invalidation window only.

Original capture: docs/sponsor-evidence/2026-10-13/03-transaction-test-proposal.png

04 / Corrected closing review

Actual correction distinguishes consent denial (422) from withdrawal conflict (409) and attributes local validation to Codex.

Original capture: docs/sponsor-evidence/2026-10-13/04-local-validation-review.png

Local validation and provenance

Codex executed the tests; WorkBuddy reviewed the reported result and did not run them.

Executed command

```
.venv\Scripts\python.exe -m pytest -o addopts='' tests/test_api.py tests/test_api_review.py tests/test_review.py -q -rs --tb=short
```

Sanitized original output

```
.........................................                                [100%]
============================== warnings summary ===============================
.venv\Lib\site-packages\fastapi\testclient.py:1
  <project>\.venv\Lib\site-packages\fastapi\testclient.py:1: StarletteDeprecationWarning: Using `httpx` with `starlette.testclient` is deprecated; install `httpx2` instead.
    from starlette.testclient import TestClient as TestClient  # noqa

-- Docs: https://docs.pytest.org/en/stable/how-to/capture-warnings.html
44 passed, 1 warning in 51.89s
```

Five added parameter cases: denied save with fresh and existing owners; denied check-in; and source withdrawal between the API precheck and storage call for save and check-in. Application logic and AI qualification gates were not changed by this sponsor review.

Source record: docs/sponsor-evidence/2026-10-13/README.md and validation.txt. Capture/source hashes: manifest.json in the same directory. Test implementation: tests/test_api.py and tests/test_api_review.py. One existing dependency deprecation warning is retained above. This 13 October result is distinct from later whole-project test totals.
